

Casso's Cream

• *Anti-Bacterial*
• *Anti-Fungal* • *Anti-Inflammatory*

"No Medicine Cabinet Should Be Without It"

Clinical Pharmacology:

Casso's Cream is a multi-specialty topical cream containing a proprietary compound of prescription pharmaceutical and OTC ingredients each of which has a specific targeted action.

Casso's Cream contains a broad spectrum anti-bacterial, highly effective in the treatment of primary and secondary bacterial infections of the skin. It also contains an anti-fungal agent, which is both fungicidal and fungistatic against a wide variety of yeast-like fungi and a weak concentration of a topical corticosteroid for the anti-inflammatory, anti-pruritic and vasoconstrictive actions. This product may treat infections that have not responded to other topical antibiotic agents.

Indications and Usage:

Topical Primary skin infections: Impetigo contagiosa, superficial folliculitis, ecthyma, furunculosis, sycosis barbae, and pyoderma gangrenosum.

Topical Secondary skin infections: Infectious eczematoid dermatitis, pustular acne, pustular psoriasis, infected seborrheic dermatitis, infected contact dermatitis (including poison ivy), infected excoriations, and bacterial superinfections of fungal or viral infections. It is useful in the treatment of infected skin cysts and certain other skin abscesses when preceded by incision and drainage to permit adequate contact between the antibiotic and the infecting bacteria. Good results have been obtained in the treatment of infected stasis and other skin ulcers, infected superficial burns, paronychia, infected insect bites and stings, infected lacerations and abrasions and wounds from minor surgery. It is recommended for wet, oozing primary infections, and greasy, secondary infections, such as pustular acne or infected seborrheic dermatitis, and where a water washable cream preparation is desired. It has been useful in infection on dry eczematous or psoriatic skin.

Topical fungal infections: Caused by *Candida albicans* and other *Candida* species.

Topical corticosteroids: Indicated for the relief of the inflammatory and pruritic manifestations of corticosteroid-responsive dermatoses.

More Topical Uses: Treatment of rash due to dermatologic drug reactions, nipple yeast infection, athlete's foot, jock itch, decubitus ulcers, diaper rash, sunburn, scalds, dermatitis and the relief of itching due to eczema, relieves rash caused by heat and perspiration.

Dosage and Administration:

Apply topically to affected area as a thin film two to three times daily. (External Use Only)
